**What you should know**

JOBST® Compri2 and JOBST® Compri2 lite are 2-layer compression systems which support the treatment of active and healed venous leg ulcers and help to reduce oedema in chronic venous insufficiency and / or lymphatic disorders by applying a graduated compression force. JOBST® Compri2 can be used for patients with an ankle brachial pressure index (ABPI) of ≥ 0.8, while JOBST® Compri2 lite is suitable for the compression treatment of patients with an ABPI of between 0.5 and 0.8. Both, JOBST® Compri2 and JOBST® Compri2 lite, are latex-free 2-layer systems. The first layer, which is a padding bandage that exerts a slight compression force, allows for an even distribution of pressure and helps to protect exposed areas. The one-sided coating prevents the compression system from slipping. The second, cohesive compression bandage is applied onto padding bandage under uniform tension. The printed ellipses should be changed into symmetrical circles by the tension applied. The JOBST® Compri2 / JOBST® Compri2 lite are only intended for SINGLE USE and can be worn for 7 days.

**Indications**
Compression treatment of venous leg ulcers and any accompanying oedemas and the compression treatment of lymphatic oedemas.

**Contraindications**
The 2-layer compression system should not be used on patients who could potentially have an allergic reaction to any one of the following components: Padded bandage: polyester / compression bandage: cotton, latex-free synthetic rubber. The compression system should not be used in the event of advanced diabetic microangiopathy, Phlegmasia coerulea dolens or septic thrombosis. Its use can occasionally lead to problems if there are any sensory disturbances in the limbs. JOBST® Compri2: High compression pressures are contraindicated for arterial disorders (arterial or predominantly arterial ulcers or for an existing or suspected arterial disorder) and for patients with an ABPI of <0.8. JOBST® Compri2 lite: If the ABPI is lower then the compression system should not be used.

**General instructions**
Please follow the internationally valid guidelines and your own in-house regulations for the control of infection. When applying the compression system, the foot should be held in a bent position (i.e. at a 90° angle to the leg). The enclosed tape measure helps to give a rough estimate of the circumference of the leg, but it is not suitable for taking an exact measurement. The decision on the progress of the treatment is the responsibility of the healthcare professional.
Warnings
If the compression force is too high, this can lead to a restriction of circulation or cause a disturbance to the blood supply. If pain occurs in the patient’s foot or toes, or his/her toes become cold and numb, the bandage should be removed at once and the healthcare professional should be contacted. Please check the application site regularly for any discolouration, pain, numbness or swelling.

Please note
1. The application of JOBST® Compri2 / JOBST® Compri2 lite should be carried out and monitored by healthcare professionals.

2. In the case of diabetes, cardiac insufficiency or advanced angiopathy, the compression treatment should be carried out under medical supervision and with regular checks.

3. As JOBST® Compri2 / JOBST® Compri2 lite does not include a wound dressing, any wounds must be treated with a suitable wound dressing before the compression bandage is applied. A comprehensive range of these is available from Cutimed®

4. It is very important to ensure that there is a good arterial circulation before applying the compression system. If a restricted arterial circulation is suspected, the ABPI should be determined.

Remarks
1. Patients who require compression therapy for the first time may possibly find it difficult to tolerate the necessary therapeutic pressure initially. In this case, JOBST® Compri2 / JOBST® Compri2 lite can be applied with reduced tension at first, and it can then be applied again later with the necessary pressure.

2. Successful compression leads to the reduction of oedema. As the drainage takes effect there will be a reduction in the circumference of the leg, which means that JOBST® Compri2 / JOBST® Compri2 lite must be applied again.
